Dielectrics,"

(The Physics of Dielectrics; Transactions of the All-Union Conference on the Physics  
of Dielectrics) Moscow, Izd-vo AN SSSR, 1958. 245 p. 3,000 copies printed.

This volume publishes reports presented at the All-Union Conference on the Physics of  
Dielectrics, held in Dnepropetrovsk in August 1956, sponsored by the "Physics of  
Dielectrics" Laboratory of the Fizicheskii institut imeni Lebedeva AN SSSR (Physics  
Institute imeni Lebedev of the AS USSR), and the Electrophysics Department of the  
Dnepropetrovskiy gosudarstvennyy universitet (Dnepropetrovsk State University).

AUTHOR: Kozlovskiy, V. Kh. 48-22-3-13/30

TITLE: Structural Losses in Amorphous Dielectrics (Strukturnyye poteri v amorfnykh dielektrikakh)

PERIODICAL: Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya, 1958 Vol. 22, Nr 3, pp. 279-282 (USSR)

ABSTRACT: Dielectric losses in amorphous dielectrics (e.g. in glass) are divided into three types: 1) Conductivity loss, 2) relaxation losses and 3) structural losses. The relaxation losses are caused by the presence of certain additional ions, e.g. alkali. Their nature was investigated both experimentally and theoretically in the works by Skanavi (Ref 1). With respect to structural losses it is observed that they are caused by the nature of the glass-forming oxide. For this reason, the author, when investigating the structural losses, neglects the two first-mentioned types as well as the ions causing them. In the case of lacking relaxing ions, the absorption of the electromagnetic energy by the amorphous dielectricum must be practically of the same nature as its absorption by the crystal. The losses in the glass must be of the resonance type; they then do not depend on temperature. The resonance absorption exists in crystals, however, only with certain frequencies

Card 1/3

Structural Losses in Amorphous Dielectrics

48-22-3-13/30

within the infrared range and with glass in a large interval of frequency. The cause of these fundamental differences must be found. In an ideal crystal, absorption is connected with two kinds of resonance, viz. According to frequency and according to the wave vector. In the amorphous structure, the forced oscillations are no plane waves and therefore the conception of the wave vector and the restrictions connected here with does no longer exist. Lifshits (Ref 3) investigated the absorption of the electromagnetic energy by the crystal with slightly deranged periodicity. Complicated calculations showed that the interruption of the periodicity leads to the absorption of energy within a range of frequency that would be inactive in an ideal crystal. Concluding, the author states that Frenkel' (Ref 5) tried to explain the temperature-dependant loss-components in glass. He suggested a mechanism for the transformation of the electromagnetic energy of the field into acoustic medium-oscillations at the expense of the metal-ions contained. The calculation of the energy which is lost by the acoustic vibrator (Ref 6) showed, however, that acoustic emission influences the losses only very slightly. The losses are obviously mainly connected with dissipation

Card 2/3

Structural Losses in Amorphous Dielectrics

processes. V. A. Ioffe (Ref 4) presumed that the losses in glass within the range of ultra-high frequencies are caused by the presence of a great number of resonators with frequencies of their own. There are 6 Soviet references.

Lebedeva, Editorial Board: (Resp. Ed.) G.I. Ginzburg, Doctor of Physics and Mathematics (Deceased), and E.V. Filippov, Candidate of Physics and Mathematics.

PURPOSE: This collection of reports is intended for scientists investigating the physics of dielectrics.

CONTENTS: The Second All-Union Conference on the Physics of Dielectrics held in Moscow at the Fizicheskii Institut imeni P.N. Lebedeva (Physics Institute, Akademiya Nauk SSSR) in November 1958 was attended by representatives of the principal scientific centers of the USSR and of several other countries. This collection contains most of the reports presented at the conference and summaries of the discussions which followed. The reports in this collection deal with dielectric properties, losses, and polarization, and with specific dielectric capacitance of various crystals, chemical compounds, and ceramics. Papers on ferroelectricity, ferroelectric crystals, and various radiation and irradiation effects on dielectrics are included. The volume contains a list of other papers presented at the conference. The volume contains a list of other breakdowns of dielectrics, which were published in the Journal *Izvestiya AN SSSR, seriya fizicheskaya*, No. 4, 1960. No personalities are mentioned.

References accompany each report.

TITLE:

A Dynamic Theory of the Deformed Ion Lattices of  
Seignettoelectric Crystals

PERIODICAL: Fizika tverdogo tela, 1960, Vol. 2, No. 8, pp. 1733-1738

TEXT: The general method of the mathematical description of seignettoelectric phenomena in crystals is based on a development of the lattice energy potential in a power series of the ion displacements, taking into account terms of at least up to the fourth order. As Born has shown, in order to include deformation, terms of order higher than the second have to be considered. In the present work a further development of Born's theory is made for seignettoelectric crystals in which the direction of spontaneous polarization does not coincide with the crystal axes. Since the consideration of ionic vibrations under non-linear forces requires extensive calculations, the author limits his consideration to linear vibrations (taking place in the x-direction).

A Dynamic Theory of the Deformed Ion  
Lattices of Seignettoelectric Crystals

S/181/60/002/008/008/045  
B006/B070

The potential energy of the ion is developed in a power series of the displacements along the x-axis and terminated at the fourth order term. Expressions of free energy of seignettoelectrics are obtained as functions of powers of polarization and deformation. The temperature dependence obtained for the coefficients  $P^2$  and  $P^4$  suggests the possibility of phase transitions of the first and the second kind. Finally it is shown that the seignettoelectric properties of a crystal can be related to interaction forces in a crystal lattice (3.9) - (3.11). It is remarked, in conclusion, that a generalization of Born's theory by taking into account anharmonic forces may lead to a correct description of many seignettoelectric properties of crystals. TITLE: On the structure of substances fixing polarization

PERIODICAL: Referativnyy zhurnal, Fizika, no. 10, 1962, 27, abstract 10E204  
("Izv. Leningr. elektrotekhn. in-ta", 1961, no. 46, 303 - 307)

TEXT: The electrostatic energy of a substance (crystalline or amorphous) conserving the polarized state after removal of the external field is calculated on the assumption of the substance being comminuted into submacroscopic regions with different directions of polarization. The calculation is performed by taking account of both the presence of a free charge  $q_f = -\alpha q_s$ , where  $0 < \alpha < 1$ , which partly compensates the polarization charge on the interfaces, and the difference between the effective field in the boundary layer and the field in the bulk. It is found that there is a minimum of energy for a given dimension of the region, and that there is an equilibrium dimension of the region depending on  $\alpha$ . ✓B

TITLE: Dynamic relaxation of ferroelectric ions in a self-consistent field /Report, 4th All-Union Conference on Ferroelectricity held in Rostov-on-the-Don 18-19 Sept 1964/

SOURCE: AN SSSR. Investiya. Ser.fizicheskaya, v.29, no.6, 1965, 874-878

TOPIC TAGS: ferroelectricity, phase transformation, relaxation kinetics, statistical thermodynamics

ABSTRACT: In his theory of ferroelectrics, W.Mason (Phys.Rev.78, 854 1947) considered the jumps of an ion between two minima of a potential well but not the motion of the ion in the minima themselves. In the present paper the author undertakes to describe this motion by means of dynamical equations and to determine its influence on the properties of the ferroelectric. A simple form is assumed for the potential well and the ion is assumed to be influenced in addition by an effective self-consistent field. The free energy is calculated and equa-

Card 1/3

tions are derived describing a dynamic phase transition corresponding to the change from vibration of the ion within the minima to its vibration over the potential barrier. Equations are also obtained that describe an order-disorder transition which can occur at a temperature below that of the dynamic phase transition. The resonance frequency for infrared absorption decreases as the temperature approaches that of the dynamic phase transition. Such a change of resonant frequency does not occur when the temperature approaches the order-disorder transition temperature. The resonance lines of the ferroelectric phase are doublets; the doublet separation is calculated. The doublet splitting may be absent in the case of rigid crystal lattices such as perovskite. Quantum effects are discussed briefly. It is found that replacing the ion by a heavier isotope increases the activation energy and the relaxation time. This is in agreement with experimental findings of H.Hill and S.Ishiki (Phys.Rev.188,1140,1968). Orig.art. has: 31 formulas.

TITLE: Phase transition in a ferroelectric crystal with domain walls  
 Report, 4th All-Union Conference on Ferroelectricity held in Rostov-  
 on-the-Don 12-18 Sept 1964

SOURCE: AN SSSR. Izvestiya. Ser.fizicheskaya, v.29, no.6, 1965, 882-886

TOPIC TAGS: ferroelectricity, phase transformation, domain structure,  
 free energy

ABSTRACT: The author discusses phase transitions in a ferroelectric  
 crystal containing domain walls. The surface energy, including the  
 energy of the domain walls, is calculated, and from this is derived an  
 expression for the free energy of a slab containing a number of equal-  
 ly spaced plane parallel domain walls. At several points in this de-  
 rivation the author quotes results from his earlier publications (Zh.  
 tekhn.fiz.23,896,1953; Zh.eksp.i teor.fiz.30,766,1956; Kristallografi-

Card 1/3

L 57024-65

ACCESSION NR: AP3016109

ya 8,819,1965) and does not always explain the meanings of the symbols thus introduced. Conditions for equilibrium and for phase transition are derived from the free energy equation. Different situations obtain, depending on the values of the parameters describing the material. 1) If the slab is very thin (from 10 to 100 Å) only the paraelectric state is possible. W.Känzig and R.Sommerhalder (Helv.Phys. Acta 26,603,1953) arrived at this conclusion in a less rigorous way. 2) There may be a stable polarized polydomain state at low temperatures which passes discontinuously into the paraelectric state at high temperatures. Expressions are given for the transition temperature and the equilibrium thickness of the domains. 3) At low temperatures there may be a metastable single-domain state in addition to the stable polydomain state. In this case the single-domain state ceases to be metastable (becomes unstable) at a lower temperature than the transition temperature to the stable paraelectric state. The metastable single-domain state can be stabilized by placing the ferroelectric slab in a capacitor and short circuiting the plates. This was first pointed out by V.L.Ginsburg (Zh.eksp.i teor.fiz.15,789,1945). Orig. art.has: 38 formulas.

Title : The toxicity of prune, cherry and apricot pits

Periodical : Priroda 3, 112-113, Mar 1954

Abstract : A warning is given against the consumption of the kernels from prune, cherry and apricot pits, because of their high poisonous effects. It is explained that these pit kernels contain amygdalin glucoside, which, under the effect of the digestive fermentations in the gastric-intestinal tracts decompose into glucose and poisonous hydrocyanic acid. The toxicity of these kernels may sometimes prove fatal.

The effect of lymphoid tissue upon calcium metabolism. V. S. Kozlovskiy (Sci. Research Inst. Orthopedics and Traumatology, Kiev). Byull. Ekspit. Biol. i Med. 38, No. 9, 42-4 (1964). In previous investigations it was established that exts. obtained from lymph nodes affect the Ca content of the skin, muscles, and serum. A similar observation was made while studying the effect of the ext. upon the Ca of the aliphoid cartilage and the compact mass of femur. Rabbits with normal serum Ca were used as test animals. Following the ext. injection the cartilage Ca increased 13.1%, that of the femur only 1%. The ext. also affected the Ca of splenectomized animals, causing an increase of 27% in the aliphoid cartilage and 7.3% in the femur. A callus formed after exptl. noncomplicated fracture of the anterior extremities contained 20% more Ca than the bones of controls.

TITLE: A device for damping vibrations. Class 87, No. 172258

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 12, 1965, 145

TOPIC TAGS: vibration, vibration damping, mechanical vibration

ABSTRACT: This Author Certificate presents a device for damping vibrations transmitted to the handle of a hand operated instrument such as a perforator. The device consists of a system of levers and springs (see Fig. 1 on the Enclosure). To dampen the vibrations, a system of levers is constructed in the form of a parallelogram, the lateral links of which are connected with spring-loaded shafts installed in the directing grooves within the internal cavity in the handle. Orig. art. has: 1 diagram.

 Glass Retorts  
 ORIG. PUB. : Przemysl Drzewny, No 3, 24-27 (1959)  
 ABSTRACT : The wood in the retort is decomposed by the con-  
 tinuous action of a mixture containing 30% steam  
 and 20% of other gaseous products, assuring the  
 production of a sufficiently concentrated solu-  
 tion of calcium acetate and other valuable prod-  
 ucts from the tar water. The optimum distillation  
 conditions are as follows: size of the wood chips,  
 150-200 mm; moisture 15%. The use of forced  
 draft in circulating the hot gases heating the  
 retort results in uniform heating of the latter,
